                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 11313, Application US/09949016
Patent No. 6812339
GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
FILE REPERENCE: CLO01307
CURRENT APPLICATION NUMBER: US/09/949,016
PRIOR APPLICATION NUMBER: 60/241,755
PRIOR FILING DATE: 2000-10-20
                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

Publication No. US20040175739A1

GENERAL INFORMATION:

APPLICANT: Alexander

APPLICANT: Adject, Paul A.

APPLICANT: Adject, Paul A.

APPLICANT: Adject, Marc

APPLICANT: Retter, Marc

APPLICANT: Corixa Corpositions and Methods for the Detection, Diagnosis and Therapy

ITLE OF INVENTION: Compositions and Methods for the Detection, Diagnosis and Therapy

ITLE OF INVENTION: Hematological Malignancies

FILE REFERENCE: 014058-013520US

A;Note: only peptides that differed in composition from the corresponding peptides of reC;Comment: Vertebrate nonmuscle cells contain two highly conserved cytoskeletal actins,
A;Note: actins beta and gamma were not distinguished in this study
C;Comment: Vertebrate nonmuscle cells contain two highly conserved cytoskeletal actins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A;Molecule type: protein

C;Comment: This protein is involved in a signal transduction that eventually leads to C;Superfamily: actin Identifying specific binding agents for substrate binding site in CCT chaperonin complex - also new peptide binding agents and their mimetics, and peptides containing a specific CCT binding site, used for treating cancer.

Disclosure, Fig 10; 97pp; English.

This invention describes a method which uses the CCT (eukaryotic type II chaperonin) complex or part of it, for identifying a binding agent that can occupy a substrate-binding site (SBS) on the CCT complex. By binding agents block an SBS so that biological activity of the CCT complex is affected, particularly its ability to fold substrates such as actin, tubulin and cyclin. The binding agents are useful for treatment of cancer, particularly when used in combination with an anticancer drug, or viral infections. Nucleic acid fragments are used to screen for agents, e.g. binding agents that modulate interaction between the CCT complex and a protein that is to be folded. The binding

toxoplasmosis, and toxic

infections (e.g., chlamydia, HIV,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens of ovarian antigens polynucleotides, antibodies and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such condittions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine
                                                                                                                                                                                                                                                                                                                                                                                                                                                     ovarian cancer; breast cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovulation; polycystic ovary syndrome; PCOS; ovarian cyst; dysmenorrhoea; endocrine disorder; infection; inflammatory condftion; immune disorder; blood disorder; respiratory disorder; neurological disorder; cardiovascular disorder; respiratory disorder; neurological disorder; gene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective; antibiliammatory; gynaecological; reproductive.

wagnitis), inflammatory conditions (e.g., mastitis, comportis and vagnitis), immune disorders (e.g., congenital and acquired vagnitis), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders), respiratory disorders, neurological disorders, gastrointestinal disorders and isorders. Ovarian antigen polypeptides and polypucleotides may also be used in screening for compounds which modulate ovarian antigen or activity. The polynucleotides may further be used for gene therapy, chromosome mapping, in the collipse of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence in the collection of the collection of the printed sequence are collective to the printed sequence data for this patent did not form part of the printed sequence are collective to the printed to the prin

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidaes, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGIT6-ABLIGIT6), expressed DNA sequences (ABLO1840-ABLIGIT6) and the encoded proteins (ABBS7737-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP41228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polymucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polymucleotides, antibodies against human ovarian antigens of ovarian antigens polymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cystes, and dysmenorrhoea), endocrine disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ovarian cancer, breast cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovulation; polycystic ovary syndrome; PCOS; ovarian cyst; dysmenorrhoea; endocrine disorder; infection; inflammatory condition; immume disorder; blood disorder; infection; cardiovascular disorder; respiratory disorder; neurological disorder; gens trointestinal disorder; urinary system disorder; drug screening; gene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective; antiinflammatory; synaecological; reproductive.

cuagnitis), inmune disorders (e.g., congenital and acquired the vaginitis), immune disorders (e.g., congenital and acquired the vaginitis), immune disorders (e.g., congenital and acquired the conformation of immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders, blood-related disorders (e.g., anaemia), cardiovascular disorders (c.g., anaemia), cardiovascular disorders and urinary system disorders. Ovarian antigen polypeptides and polymucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the collections and prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention trained to 2175 Hover numen ovarian antigens (ABP41228) and to coDRAs encoding them (ABO64131-ABO6505), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the thrention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides against human ovarian antigens, and the use of ovarian integens ovary and/or breast related disorders. Such conditions include ovarian cancer and breast cancer, and metastric tunnours of ovarian or breast origin, reproductive system disorders (e.g., infertinity, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infections (e.g., chlamydia, HIV, toxoplamenosis, and toxic shock syndrome), inflammatory conditions (e.g., congenital and acquired therefores, infections (e.g., congenital and acquired toxoplamentories, autoimmune ophorities, systemic lupus erythematosus, chood-related disorders (e.g., anaemia), cardiovascular disorders, blood-related disorders (e.g., anaemia), cardiovascular disorders (blood-related disorders, neurological disorders, gastrointestinal disorders of polymulate ovarian antigen expression or activity. The polymucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may be used as food additives or to prepare antibodies (e.g., pushing in disease diagnosis, drug targeting and phenotyphing. The present sequence represents a human ovarian antigen of the invention. Note: The squence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed of the prin
   invention relates to 2175 novel human ovarian antiqens (ABP41054-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ftp.wipo.int/pub/published_pct_sequences

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cativity of (II) as useful in gene therapy techniques to restore normal activity of (II) to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II), (I) and (II) are useful for treating disorders of polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in parent did not appear in the printed specification, but was obtained in Gaps diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity. .. 0 Length 207; Indels Human; gene expression; single exon probe; microarray; alternative splicing event; genomic alteration. 100.0%; Score 81; DB 4; I 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                             The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially.

Compressed in human cells or tissues. Also included are a spatially.

Compression (comprising a plurality of single exon nucleic acid gene expression (comprising a plurality of single exon nucleic acid adversesably isolatable or amplifiable from the plurality), a single con microarray for measuring human gene expression, a method of configuous amino acide of any of the above—mentioned amino acide above, an ORF-encoded peptide comprising at least 8

Configuous amino acide of any of the above—mentioned amino acide above, nucleosing specifically to a peptide cited above, and sequences (optionally with conservative amino acid substitutions), an isolated antibody that binds specifically to a peptide cited above. The probe or microarrays to a customer desiring to measure gene expression, a method of providing thuman gene expression data by subscription, and a computer-readable crorage medium which contains a database having a plurality of records cited above. The probes may be used as tools for surveying testorage medium which contains a database having a single exon probe cited above. The probes may be used as tools for surveying testorage to detect the presence of expression of a single exon microarrays. In addition, the probes are used in identifying and characterising and characterising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    alternative splicing events, in detecting and characterising gross alterations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formet directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pigA3Cy3GFP plasmid protein product (Cycle3 GFP under an actin promoter).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         piggyBac; transposon; transposase; gene transfer; plasmid; Cycle3 GFP; actin promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 81; DB 8; Length 219;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      into an insect cell. Specifically, it refers to a foreign gene occurring between inverted repeat sequences of a piggyBac transposon and using a piggyBac transposon and using a piggyBac transposon and using a efficiency. The present invention describes the insect cell as that of Lepidoptera insect origin, preferably it is the silk worm Bombyx mori, and stable integration occurs into the genome of this insect using the transposase enzyme. In particular, this gene transfer method uses the plasmid pigA3Cy3GFP which contains a Cycle3 GFP gene expressed under a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      silk worm actin promoter (A) promoter) between a pair of inverted repeat sequences of the transposon (A) promoter. This polypebtide sequence is the protein product from the pigA3Cy3GFP plasmid DNA that represents the silkworm actin promoter controlling expression of the Cycle3 GFP gene given in an exemplification of the invention. NOTE: This sequence is given as an embedded protein in the sequence listing and is not referred to further within the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel method for introducing a foreign gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                        The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A Misgurnus mizolepis growth hormone expression vector - containing DNA
                                                                                                                                                                                                                                                                                                                                                               are useful as pharmaceutical agents. The present sequence represents a
protein sequence of the invention.

which contains the beta actin gene and beta actin gene controlling site of Misgurnus mizolepis. Also described are: (1) an expression vector containing a growth hormone gene and the beta actin gene controlling site of Misgurnus mizolepis; and (2) a method for the preparation of a high growth transformed Misgurnus mizolepis including a step of finely injecting the above expression vector to fertilised eggs of Misgurnus mizolepis and hatching them. The vector can be used for the expression of useful genes in a fish. The method can reduce the breeding period of Misgurnus mizolepis. The present sequence represents the Misgurnus mizolepis actin amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treatment for sickle cell anemia comprises administering a reducing agent to inhibit and reverse sickled cell formation in blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention provides a treatment for sickle cell anaemia, which comprises administering a reducing agent. The treatment inhibits the formation of irreversible sickled cells (ISC) and reverses ISC formation in the blood. The present sequence represents the human beta-actin protein. The sequence is used in the invention to demonstrate that a distulphide bridge is formed between cystelines 284 and 373 in ISC beta-actin as a post-translational modification. The reducing agent used in the treatment acts to correct this post-translational modification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Beta actin; post translational modification; sickle cell anaemia; irreversibly sickled cell; ISC; treatment.

This sequence is encoded by a drug resistant structural gene which may be used in the expression vector of the invention. This gene is used as the selective marker in the vector. The resulting vector may be used to transform a thymidine-kinase deleted cell allowing introduction of a foreign structural gene. The transformed cell may be used to produce large amounts of useful protein
                                                                                                                                                                                Expression vector contg. drug resistant marker gene - useful for transformation of thymidine kinase-deleted human cells for high levels of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New cardiac actin gene comprising histidine to arginine or glycine to glutamic acid substitution, useful in the diagnosis of diseases associated with the mutation, specifically idiopathic dilated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chromosome 15q14;

The present invention relates to human cardiac actin (ACTC). Genotypic analyses show that ACTC is linked to idiopathic dilated cardiomyopathy (IDC). The ACTC gene maps to chromosome 15414. Six PCR primer pairs (AAA49020 to AAA49031) have been developed to allow analysis of the six exons of ACTC. Studies of two families with IDC showed the presence of two mutations, one in exon 5 and one in exon 6. The present sequence is a mutant of posttranslationaly modified ACTC without the initial two residues. The mutation is a Glu to Gly mutation at position 361. The ACTC protein may be used in a variety of methods for drug screening and for rational drug design. The ACTC gene may be used to treat IDC by gene therapy. Analysis of the ACTC gene provides early identification of subjects likely to develop or who already have IDC. Note: The present sequence described in AAY94569
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human cardiac actin protein after posttranslational modification.
                                                                                                                                                                                                                                                                                                                                                         Score 81; DB 3; Length 375;

The present sequence is human cardiac actin (ACTC) protein, without the initial Met-Cyg which is posttranslationally removed. Genotypic analyses show that ACTC is linked to idiopathic dilated cardiomyopathy (IDC). The ACTC gene maps to chromosome 15q14. Six PCR primer pairs (AAA49020 to AAA49931) have been developed to allow analysis of the six exons of ACTC. Studies of two families with IDC showed the presence of two mutations,

New cardiac actin gene comprising histidine to arginine or glycine to glutamic acid substitution, useful in the diagnosis of diseases associated with the mutation, specifically idiopathic dilated

One in exon 5 and one in exon 6. The mutations are G to A in codon 312 (Arg312His) and A to G in codon 361 (Glu361Gly). The ACTC protein may be used in a variety of methods for drug screening and for rational drug design. The ACTC gene may be used to treat IDC by gene therapy. Analysis of the ACTC gene provides early identification of subjects likely to develop or who already have IDC

                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6063576

GENERAL INFORMATION:
APPLICANT: Keating, Mark T.
APPLICANT: Olson, Timothy M.
TITLE OF INVENTION: Cardiomyopathy, a Heritable Form of Heart Failure
INUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
ADDRESSEE: Rothwell, Figg, Ernst & Kurz, P.C.
STREET: 555 Thirteenth Street, N.W., Suite 701 East
                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US-10-264-049-4148

Sequence 4148, Application US/10264049

Publication No. US20040005579A1

GENERAL INFORMATION:

TITLE OF INVENTION: Nucleic Acids, Proteins, and Antibodies

TITLE REFERENCE: PA13191

CURRENT APPLICATION NUMBER: US/10/264,049

CURRENT APPLICATION NUMBER: PCT/US01/18569

PRIOR FILING DATE: 2001-06-07

PRIOR FILING DATE: 2001-06-07

PRIOR FILING DATE: 2000-06-07

NUMBER OF SEQ ID NOS: 4360

SOFTWARE: Patentin Ver. 3.1

In alle controls Archins are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in all eukaryotic cells (By similarity).
In MILARITY: Belongs to the actin family.
